

Group Decision

Honest group decisions through anonymous confidence voting — product overview

Executive summary

When a team debates its next move in a meeting, the loudest voice and the most senior title usually win. People hold back honest doubts, and the group leaves without knowing where confidence really sits. **Group Decision** fixes this: everyone in the room scores every option anonymously, and the group's true ranking appears the moment voting ends.

A meeting runs in minutes: the host signs in with Google, types the problem to solve, and reads out a 6-digit join code. Participants join from any phone or laptop, and depending on the workflow the host chose, either **submit one anonymous idea each** (Crowdsourced) or vote directly on **options the host prepared** (Preset). Voting itself is the signature moment — each option is a card the participant swipes to score from 0 (reject) to 100 (strong confidence), fast enough to be fun and precise enough to matter.

When everyone has voted — or the host closes voting — every participant sees the ranked outcome instantly. The host additionally gets a private report: how tightly the group agreed on each option, and how support differs across departments, roles, and tenure — with small groups automatically hidden so no individual can ever be singled out.

Why people vote honestly

Ideas carry no names, individual scores are never shown to anyone — including the host — and any report breakdown covering fewer than three people is replaced with "too few to display". Honest input is safe by design.

Two workflows

- **Crowdsourced** — participants each submit one anonymous idea; the host merges duplicates and removes noise before the vote.
- **Preset** — the host prepares the list of options in advance; participants go straight to voting.

What the host gets

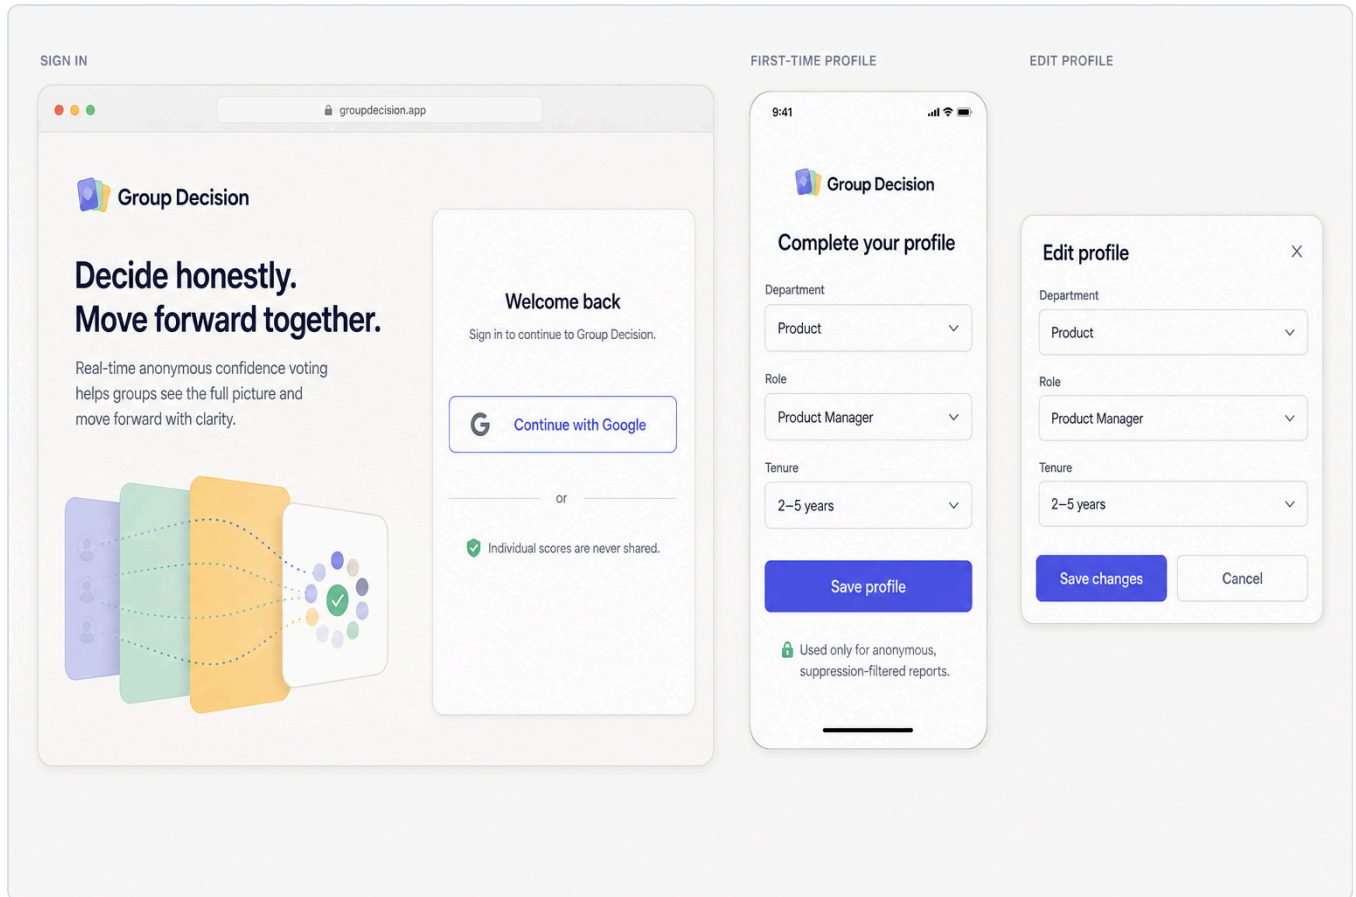

- The ranked list everyone sees, plus a private report.
- Consensus at a glance — genuine agreement vs. a polarised split hiding behind the same average.
- Breakdown by department, role, and tenure; export to CSV for slides.
- A saved history of every past session and report.

The pages that follow walk the product screen by screen, host and participant side by side, using the current design mocks.

STEP 1 — SIGN IN & PROFILE

One tap to get in, three questions to power the insights

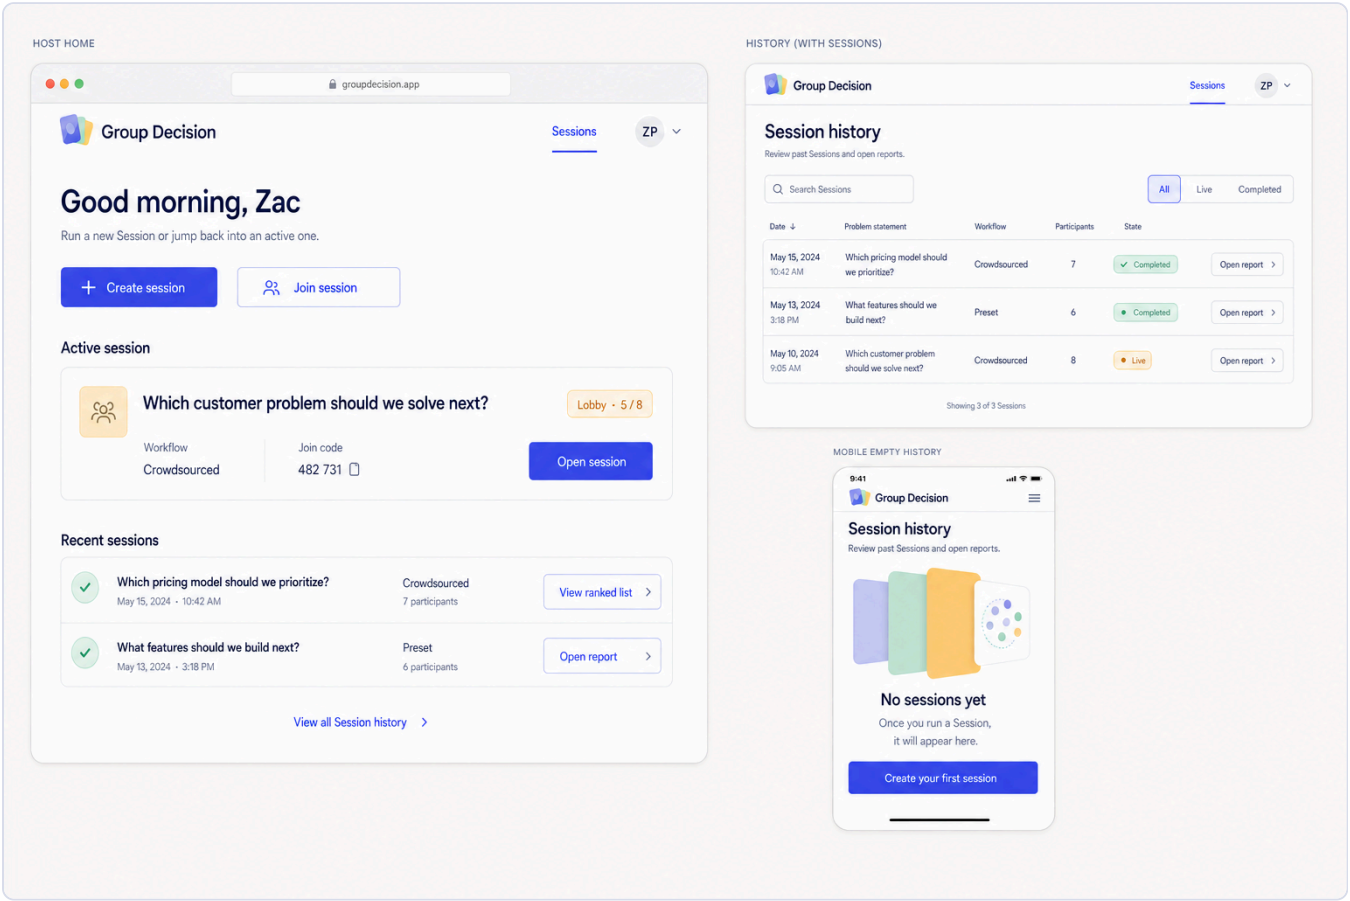

Everyone signs in with their Google account — no passwords, no setup. On first sign-in, a short profile (department, role, tenure) takes ten seconds; it exists purely so the host's report can show where in the organisation support and resistance live, and it is never attached to any visible vote or idea.

STEP 2 — HOME & HISTORY

Start a session or jump back into one

The host's home shows any session currently running — with its join code ready to read out — plus recent results one tap away. Every past session and its report is kept, so a decision made months ago can be revisited any time.

STEP 3 — CREATE A SESSION

Type the problem, pick the workflow

The host writes the problem statement, chooses Crowdsourced or Preset, sets how many people can join, and decides whether to vote alongside the group or stay a neutral facilitator. Choosing Preset adds one step: entering the options the group will vote on.

STEP 4 — JOIN

A 6-digit code, read out loud

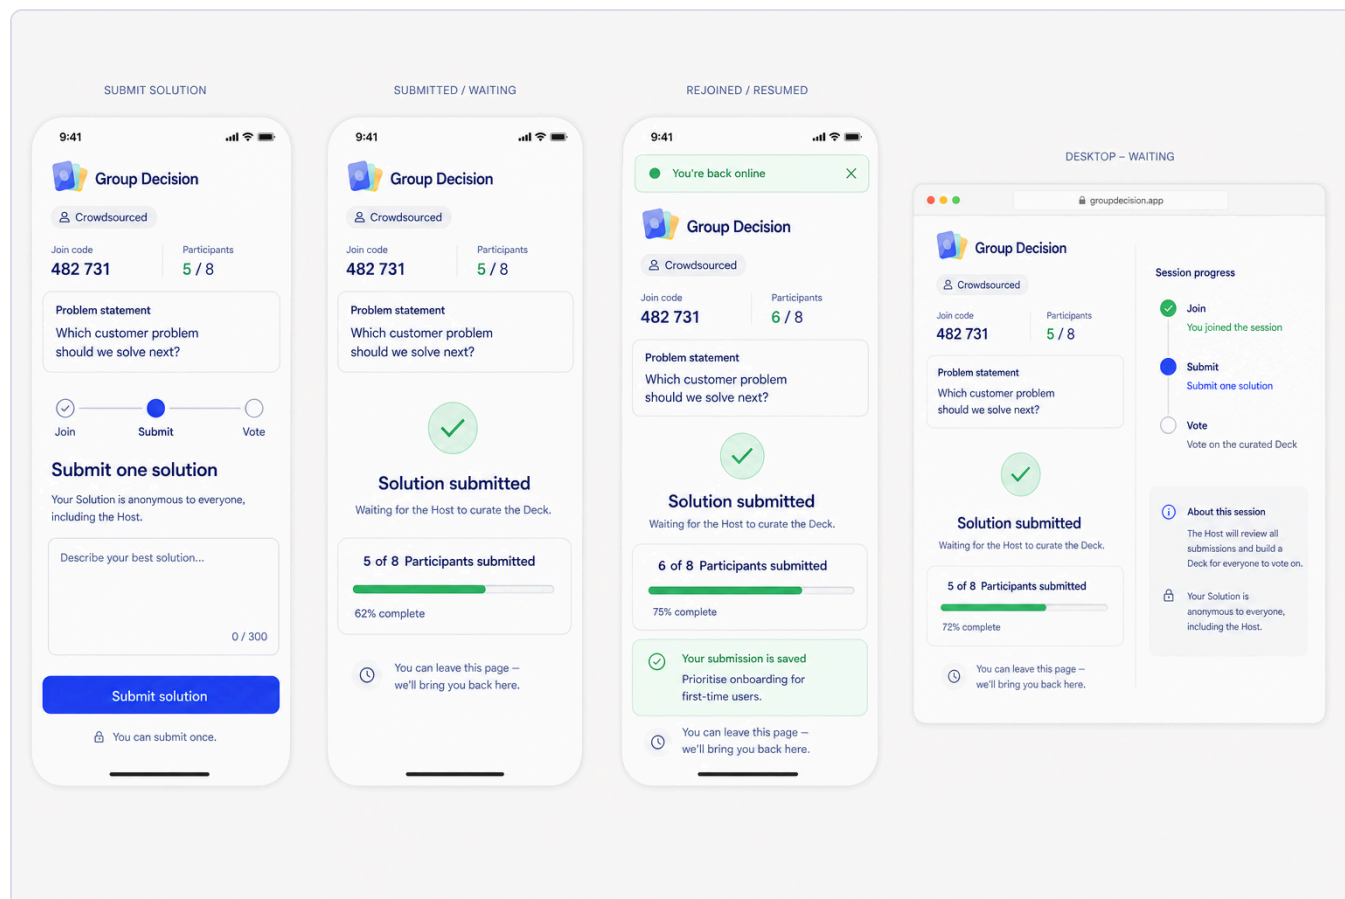

Participants type the code and see the session before committing to join. Clear, friendly screens handle every miss: a mistyped code, a full room, or arriving after voting has already begun.

STEP 5 — SUBMIT AN IDEA (CROWDSOURCED)

One anonymous idea per person

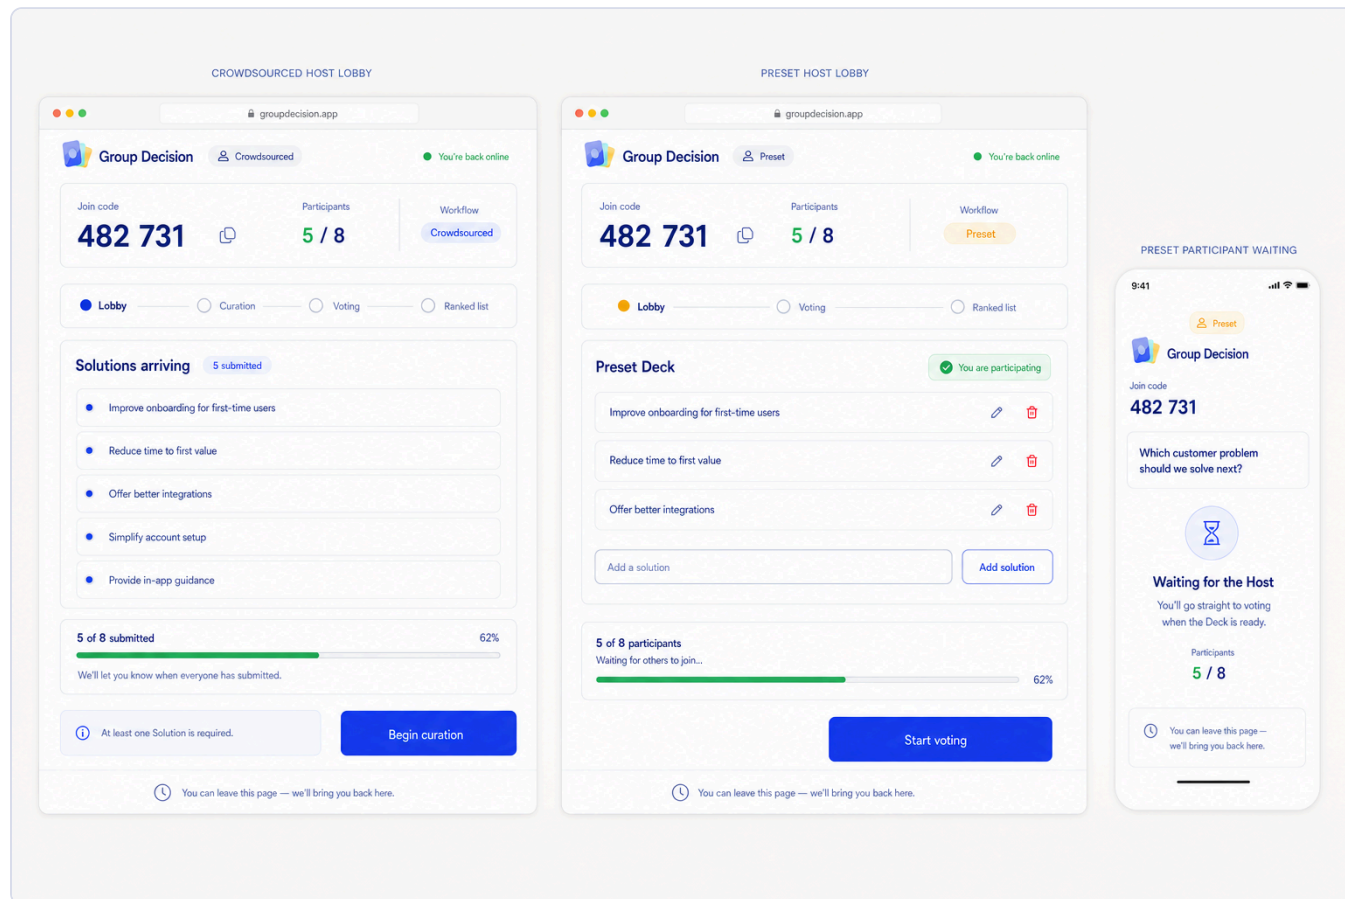

Each participant submits exactly one idea — anonymous to everyone, including the host — then waits on a live progress screen. Closing the tab loses nothing: coming back resumes exactly where they left off.

STEP 6 — THE HOST'S ROOM

Watching the room fill

The host sees people join against the cap and — in Crowdsourced — ideas arriving live. In Preset, the host can still fix a typo or add a late option right up until voting starts.

STEP 7 — CURATE THE DECK (CROWDSOURCED)

Merge duplicates so ideas don't split the vote

Before voting, the host tidies the list: combining near-duplicates into one clearly worded option and removing anything irrelevant. The group votes on a clean, fair deck.

STEP 8 — VOTE

Swipe to score: 0 to 100

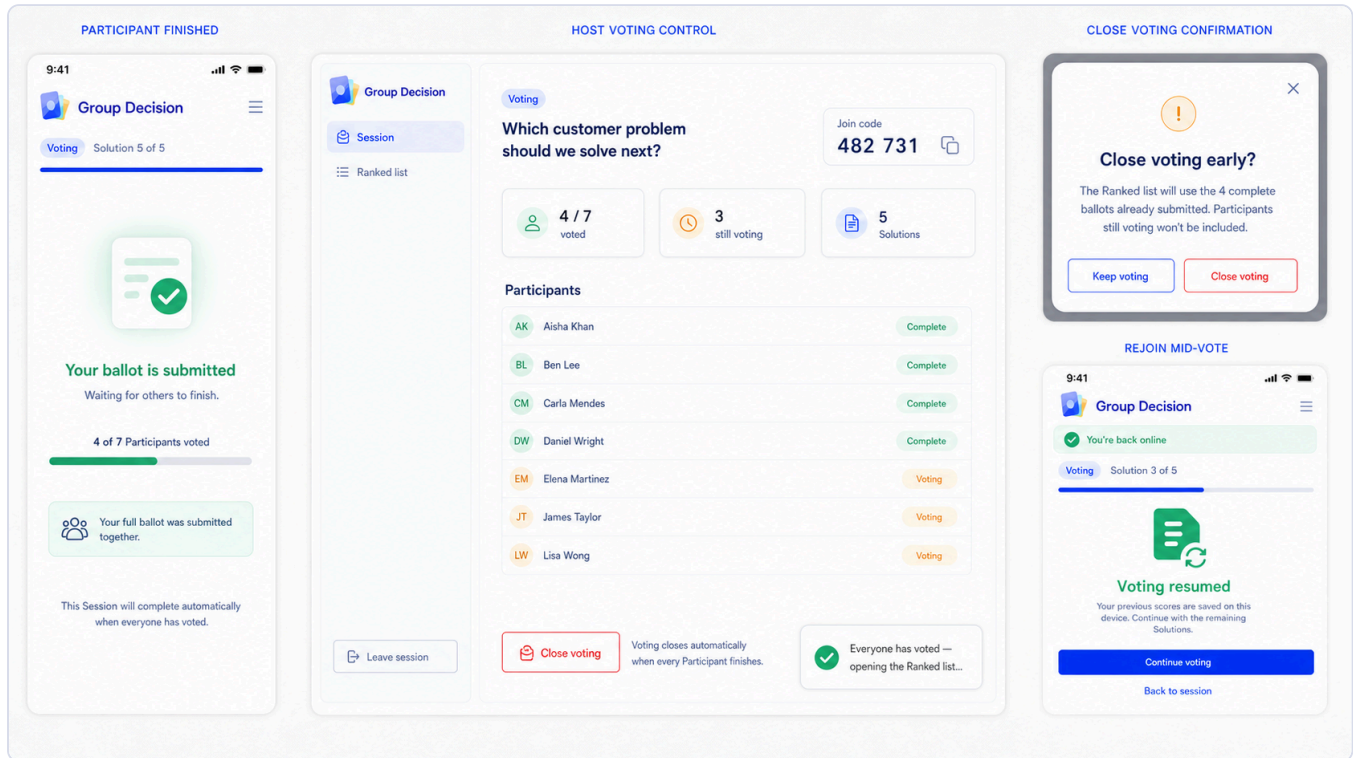

Each option is a card. Swiping around the ring dials in a confidence score with live colour feedback — release to cast. A precise-adjustment mode and manual buttons are there for anyone who wants exact control. Scores stay private on the device until the final card, then the whole ballot is submitted in one go.

STEP 9 — EVERYONE'S IN

The room finishes together

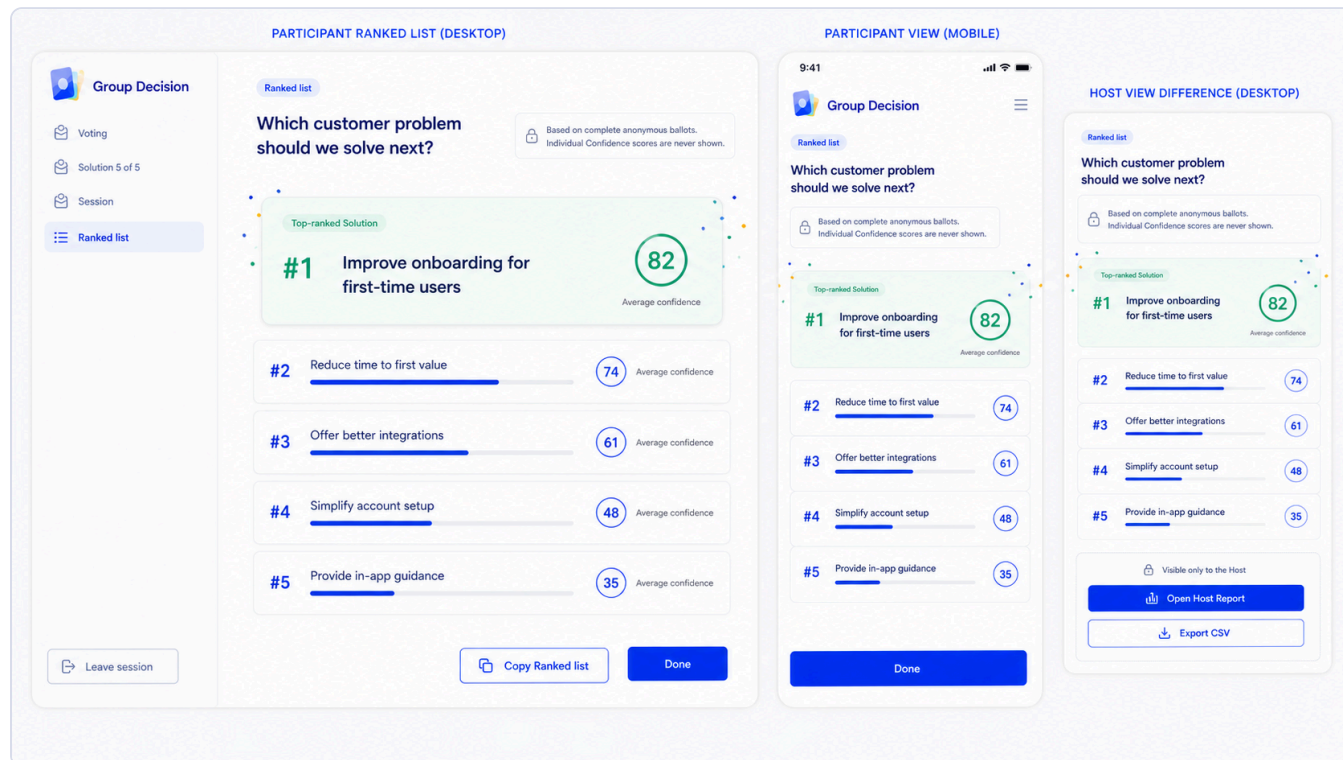

Finished participants see live progress; the host sees who is still voting and can close early with the votes in hand, so one distracted phone never holds the meeting hostage. The moment the last ballot lands, results open for everyone automatically.

STEP 10 — THE RESULT

The group's decision, ranked and immediate

Every participant sees the same thing at the same time: all options ranked by the group's average confidence, winner on top. No waiting for a write-up, no debate about what the room "really thought".

STEP 11 — THE HOST'S REPORT

Consensus, not just averages

The private report shows how tightly the group agreed on each option — separating genuine consensus from a polarised 50/50 split hiding behind the same average — and breaks support down by department, role, and tenure. Any breakdown covering fewer than three people is hidden to protect individuals. One click exports everything to CSV for slides.
